

Enterprise Resilience Management Systems

Protecting your information assets with
ISO/IEC 27001:2013 Information Security Management System Standard

The Information Asset Challenge

Singapore is a SMART nation based on modern Information Communication Technology (ICT) infrastructure. In a highly networked business environment, businesses are dependent on information systems and services. With this comes incredible benefits but also all types of information security threats.

To build resilience against threats you must look at Information is an asset, which, like other important business assets, has great value to an organisation and consequently needs to be suitably protected. It is of paramount importance that businesses are familiar with information security risks and have robust management processes to safeguard assets and business processes of their organisation and their business partners.

Dependence on information systems and services means organisations are more vulnerable to security threats.

By proper identification and classification of these assets and a systematic risk assessment of threats and vulnerabilities, your business can select appropriate controls to minimise and manage risks. It can then demonstrate that it is preserving confidentiality, integrity and availability of these information assets to clients, consumers, shareholders, authorities and society in general.

What Strategy Should be Applied?

With resilience comes competitiveness. Safeguarding this key resilience area of Information Security is vital to your disruption mitigation strategy.

The ISO/IEC 27001:2013 standard for Information Security Management presents the most effective solution in managing threat and risk concerns. It is based on a common integrated security management system approach.

What is ISO 27001?

ISO 27001 is an international standard that helps organisations keep information assets secure. It provides a framework to develop policies and procedures that includes all legal, physical and technical controls. These controls prevent information assets falling into wrong hands or losing it forever.

ISO 27001 specifies the requirements for establishing, implementing, maintaining and continually improving your Information Security Management system.

The approach is systematic and can be scaled in accordance to the needs of your organisation. It involves the use of sound risk management processes to manage security.

Does ISO 27001 apply to all industries?

Yes, all organisations that have information assets can benefit from the implementation and certification of an Information Security Management System. The Standard is applicable, regardless of the size or nature of the business.

Is ISO 27001 only about IT?

No, ISO 27001 covers people, processes and IT systems and all aspects of information exchange. This can be computer data, printed documentation, intellectual property and verbal conversations. This also includes the securing of physical perimeters and initial personnel screenings.

Can I obtain Government funding to implement ISO 27001?

An Enterprise Development Grant is available to SMEs upon application to Enterprise Singapore for ISO 27001. Singapore based SME companies can apply for support to help defray part of the cost of consultancy and certification.

Who can help with ISO 27001 implementation & Enterprise Singapore funding application?

Of course not all organisations have the skill, or available resources to implement the ISO 27001 standard to a compliant level. LSA Consultants will provide you with an end to end solution starting with assistance with the grant application process. Followed by the project management capability and training to effectively engage your management, staff and key stakeholders to implement, test and audit your ISO 27001 ISMS to reach compliance status against the standard and achieve certification.
